Dear Editor,

The attached 4000 word review links two key physics references (Frohlich 1968 and Giamarchi 2008) to the more general biological and philosophical fields of mind and consciousness. The abstract for a manuscript in preparation which lays out the author's novel theory of mind is attached.

The review provides an overview of the state of play in the progress towards a scientific theory of mind. Drawing from neurobiology, molecular biology, biological physics, and philosophy of mind and consciousness, this review introduces a previously speculative field to natural philosophy. From a most general perspective, this review can act as a seed for subsequent hard science. The interdisciplinary nature of the journal exposes an exciting area for observational and theoretical neuroscience.

Sincerely,

Vivian McPhail
